

PRACTICE SESSION

MIEKE MEURS

Students will work in groups of 5. Each group will design a study using the concept of gender bargaining power, either examining whether an intervention variable affects gender bargaining power, or examining whether gender bargaining power affects another outcome (for example, fertility, children's education).

Each group will:

- 1) Define the research question and your hypothesis.
- 2) Propose a basic model to test the relationship.
- 3) Carefully define the variables that will be used, linking these to theoretical concepts of bargaining power.
- 4) Carefully the sample that will be used.
- 5) Explain the appropriate econometric method.

Groups will have 30 minutes to discuss and design their project in consultation. This will be followed by "lightening talks" of 5 minutes per group, in which the above 5 points are covered, and group comments on each talk.
